

AFDI FAUZUL BAHAR

Full-Stack Programmer

I am a full stack programmer there which one which prefers the backend stack with more than 2 years experience in web app development. With my educational background in Bachelor of Information Engineering and several projects I have worked on, I have gained a strong understanding of writing clean code, reliable and unit test. I have expertise in programming languages such as PHP, ReactJs, Python, Golang, as well as in using frameworks such as Laravel, Laravolt/Alurkerja(Internal), Gin, and NextJs.

My experience in building and maintaining backend infrastructure has enriched my understanding of the principles of performance optimization and scalability. I believe that this strong foundation gives me the ability to design appropriate solutions to complex technical challenges. Additionally, I have contributed to the development of RESTful APIs and integration with cloud services such as AWS and OKD, ensuring applications run smoothly and securely in production environments.

In addition to technical skills, I highly value effective team collaboration and clear communication. I have become accustomed to working in cross-functional teams, coordinating with product development and product management teams to ensure overall project success. I believe that the combination of strong technical skills and good interpersonal skills makes me an important player for the team. I am very interested in joining PT. Synapsys Digital Synergy and contribute to the company's vision and mission in providing comprehensive services ranging from analysis, design, prototyping, manufacturing and installation of integrated IoT solutions.
